

Andrew R. Talley

SENIOR SOFTWARE ENGINEER

Granite City, IL | 618-975-6674 | andrewtalley95@gmail.com | github.com/AndrewTalley | andrewtalley.github.io

PROFESSIONAL SUMMARY

Senior Software Engineer with 7+ years building cloud-native, data-intensive systems in healthcare. Specializes in modernizing legacy platforms onto Kubernetes, designing ETL pipelines that produce tens of thousands of files daily, and building internal tooling that has reduced production-support load by roughly 30%. Works fluently across Go, Node.js, .NET, and TypeScript, with deep experience in microservices, AWS, and large-scale data integration.

TECHNICAL SKILLS

Languages: Go, TypeScript, JavaScript, C#, Python, Java, SQL

Backend & Runtimes: Go (Gin, GORM, Templ), Node.js, .NET (4.5 and 8.0), microservices, REST and GraphQL APIs, WebSockets

Frontend: React, TypeScript, HTML/CSS, Tailwind

Cloud & Infrastructure: AWS (S3, Rekognition), Kubernetes, Docker, Railway

Data & Databases: Snowflake, PostgreSQL, MongoDB, MS SQL Server, Oracle, Redis

DevOps & Tooling: GitLab CI/CD, Control-M, Git

Testing & Quality: Jest, Go testing, unit and integration testing, code review

PROFESSIONAL EXPERIENCE

Centene Corporation, Clayton, MO

2019 – Present

Senior Software Engineer (2023) · Software Engineer (2021) · Junior Software Engineer (2019)

- Led the migration of a legacy .NET 4.5 application to .NET 8.0, re-platforming from on-premises servers to Kubernetes and replacing SFTP delivery with AWS S3 orchestrated through Control-M. Added structured logging and metrics that significantly improved system resilience and observability.
- Designed and own an end-to-end ETL pipeline that generates 60 to 80 output files daily. A cron scheduler pulls configuration from MongoDB, a job runs the extract query, a schema-driven formatter transforms the results, and a Java service writes XML and CSV files for downstream delivery.
- Rebuilt the team's internal job-execution tool from vanilla JavaScript to React, enabling roughly 10 business users to run jobs themselves and cutting the team's production-support load by approximately 30%.
- Established Snowflake for the team and rewrote eight MSSQL queries as Snowflake views across three markets, consolidating legacy and cloud data sources into a single source of truth and eliminating duplicate data pulls.
- Serve as senior engineer on a four-developer team building and operating the Electronic Visit Verification (EVV) platform, which comprises five Node.js microservices and a Java file-generation application and helps reduce fraud, waste, and abuse in home health care across 20+ markets.
- Built an automated reporting pipeline that queries MongoDB and uses AI to generate charts and dashboards from raw data, after taking ownership of reporting from another team.
- Mentor junior developers, lead design and architecture decisions, and set technical direction for the team.

Aclara Technologies, St. Louis, MO

2018 – 2019

Technical Support Engineer

- Sole engineer responsible for the Synergize RF product line end to end while supporting Advanced Metering Infrastructure (AMI) for rural electric cooperatives nationwide. Wrote dynamic SQL for daily operations and partnered with systems engineering on algorithms that improved product efficiency.

Centene Corporation, Clayton, MO

2017 – 2018

Business Analyst, IT Product & Health Care Services

- Supported Electronic Visit Verification and HD Voice initiatives across multiple departments and presented EVV work at the NASUAD national conference.

SELECTED PROJECTS

PCC (Prime Championship Circuit). Full-stack esports platform. *React/TS · Go (Gin, GORM) · PostgreSQL · Redis · AWS*

- Competitive league platform for the MOBA Predecessor, supporting team management, match scheduling, and Swiss-system tournaments with auto-generated brackets, plus player and team profiles synced from a third-party game API by a background worker.
- Built a server-authoritative WebSocket draft tool with captain validation, server-run timers, per-team time banks, and side selection. Implemented Steam and email authentication (JWT access and refresh tokens) and S3 logo uploads auto-moderated through AWS Rekognition, plus a companion Discord bot.

Ortus.gg. Predecessor analytics platform. *Go · Templ · GraphQL · Railway*

- Shipped as a single self-contained Go binary featuring a Gin and templ server-rendered UI, a GraphQL data layer, and an installable PWA with embedded static assets, deployed on Railway.
- Built a build analyzer that turns raw match data into hero insights, matchup analysis, and a tier list, alongside spectator links and history, export, and stats features.

Lulla (Sleep Schedule). Full-stack web app. *React/TS · Vite · Tailwind*

- Personalized baby sleep-schedule app with secure authentication and email verification, PDF export, a tiered subscription model (Free, Basic, and Premium), and Chart.js analytics dashboards.

Coffer. Chrome extension. *JavaScript · Manifest V3*

- Manifest V3 extension that saves AI responses from ChatGPT, Claude, and Gemini into a searchable, local-first vault with folders, tags, and Markdown export. Uses per-platform content-script adapters built on shared extraction logic.

Additional projects on GitHub: a Node.js e-commerce REST API, a Go Pokédex CLI, and several React applications.

EDUCATION

Southern Illinois University Edwardsville (SIUE), Edwardsville, IL

May 2018

B.S. in Computer Management and Information Systems · Specializations: IT and Business
