

Andrew R. Talley

SENIOR SOFTWARE ENGINEER

Granite City, IL • 618-975-6674 • andrewtalley1995@gmail.com • github.com/AndrewTalley

PROFESSIONAL SUMMARY

Senior Software Engineer with 7+ years building cloud-native, data-intensive systems in healthcare. Polyglot across Go, Node.js, .NET, TypeScript, Python, and Java, with hands-on depth in microservices, AWS, Kubernetes, and large-scale data integration. I modernize legacy systems, build internal tooling that removes operational toil, and ship full-stack side projects end to end — from Go/GraphQL services to React front ends.

TECHNICAL SKILLS

Languages: Go, TypeScript, JavaScript, C#, Python, Java, SQL

Backend & Runtimes: Go (Gin, GORM, templ), Node.js, .NET (4.5 & 8.0), microservices, REST & GraphQL APIs, WebSockets

Frontend: React, TypeScript, HTML/CSS, Tailwind

Cloud & Infrastructure: AWS (S3, Rekognition), Kubernetes, Docker, Railway

Data & Databases: Snowflake, PostgreSQL, MongoDB, Microsoft SQL Server, Oracle, Redis

DevOps & Tooling: GitLab CI/CD, Control-M, Git

Testing & Quality: Jest, Go testing, unit & integration testing, code review

PROFESSIONAL EXPERIENCE

Centene Corporation Clayton, MO 2019 – Present

Senior Software Engineer (2023) · Software Engineer (2021) · Junior Software Engineer (2019)

- Senior engineer on a 4-developer team that builds and operates the Electronic Visit Verification (EVV) platform — five Node.js microservices and a Java file-generation application — helping eliminate fraud, waste, and abuse in home health care across 20–30 markets.
- Led the migration of a legacy .NET 4.5 application to .NET 8.0, re-platforming from on-prem servers to Kubernetes and replacing SFTP delivery with AWS S3 orchestrated via Control-M, while adding structured logging and metrics that made the process significantly more resilient and observable.
- Designed and own an end-to-end data-integration (ETL) pipeline that generates 60–80 output files daily: a cron scheduler pulls configuration from MongoDB, a job executes the extract query, a schema-driven formatter transforms the results, and a Java service writes the files (XML, CSV) and delivers them downstream.
- Stood up Snowflake for the team and re-wrote 6–8 existing MSSQL queries as Snowflake views across three markets, consolidating classic and cloud data sources into a single source of truth and eliminating duplicate data pulls.
- Rebuilt the team's internal job-execution tool from vanilla JavaScript to React, enabling ~10 business users to self-serve job execution and cutting the team's production-support load by roughly 30%.
- Built an automated reporting pipeline that queries MongoDB and uses AI to generate charts and dashboards from raw data, after taking over reporting ownership from another team.
- Mentor junior developers, lead design and architecture decisions, and set technical direction for the team.

Aclara Technologies St. Louis, MO

Jun 2018 – 2019

Software Engineer

- Supported Advanced Metering Infrastructure (AMI) solutions for rural electric cooperatives nationwide.
- Maintained two proprietary products, TWACS and Synergize RF, serving as the sole engineer owning the Synergize RF product line end to end.
- Wrote dynamic SQL queries to support daily operations and partnered with systems engineering on algorithms that improved product efficiency.

Centene Corporation Clayton, MO

2017 – 2018

Business Analyst — IT Product & Health Care Services

- Analyzed and supported initiatives including Electronic Visit Verification and HD Voice, and presented EVV work at the NASUAD conference.
- Partnered across departments (e.g., Payroll) using Word, Excel, Visio, and PowerPoint to organize and improve operational processes.

SELECTED PROJECTS

PCC — Prime Championship Circuit — full-stack esports platform [React + TS / Go API](#)

- Competitive-league platform for the MOBA Predecessor: player and team profiles synced from a third-party game API by a background worker, team management, match scheduling, and Swiss-system tournaments with auto-generated brackets.
- Built a server-authoritative, WebSocket-driven draft tool (captain validation, server-run timers, per-team time banks, side selection) on a Go (Gin/GORM) + PostgreSQL backend with Redis, Steam + email auth (JWT access/refresh), and AWS S3 logo uploads auto-moderated via Rekognition; companion Discord bot.

Ortus.gg — Predecessor analytics platform [Go · templ · GraphQL](#)

- Companion/analytics site built as a single self-contained Go binary: Gin + templ server-rendered UI, a GraphQL data layer, and an installable PWA with embedded static assets, deployed on Railway.
- Built a real-time, WebSocket-driven draft tool (multiple modes, server-run timers, spectator links, history/export/stats) and a build analyzer that turns raw match data into hero insights, matchup analysis, and a tier list.

Lulla — Sleep Schedule — full-stack web app [React + TypeScript](#)

- Full-stack app for personalized baby sleep schedules — React 18, TypeScript, Vite, and Tailwind front end backed by a TypeScript service layer; secure auth with email verification, PDF export, a tiered subscription model (Free/Basic/Premium), and Chart.js analytics dashboards.

Coffer — Chrome extension [JavaScript · Manifest V3](#)

- Manifest V3 extension that saves individual AI responses from ChatGPT, Claude, and Gemini into a searchable, local-first vault with folders, tags, and Markdown export; per-platform content-script adapters with shared injection/extraction logic and an HTML-to-Markdown converter.

Additional projects on GitHub: a Node.js e-commerce REST API, a Go Pokédex CLI, and several React applications.

EDUCATION

Southern Illinois University Edwardsville (SIUE) Edwardsville, IL May 2018
B.S. in Computer Management and Information Systems · Specializations: IT and Business
